**Invasive Cardiovascular
Therapy** Jul 02 2020 In recent
years considerable progress
and new developments in

diagnostic and interventional cardiology have been observed, such as balloon angioplasty of coronary artery stenoses, reperfusion techniques in acute myocardial infarction, new pacing, and cardioversion-defibrillation techniques in ventricular tachyarrhythmias. On 5-8 May, 1985, an international symposium on 'Invasive Cardiovascular Therapy' was held in Cologne, which provided a survey on the experimental and routine therapeutic measures presently available and practiced in cardiovascular medicine. This volume is based on the oral presentations given during the symposium. In five chapters the most important traditional and new interventional techniques are discussed by experts in the field. Chapter I contains a description of results from catheter palliation of congenital shunt disorders or relief of congenital pulmonary or aortic valve stenoses as well as the recent experience with surgical repair of single ventricle, Fallot's tetralogy and tricuspid atresia.

Chapter II presents the surgical results of valve replacement with different valve prostheses in acquired valvular disease, the surgical management of bacterial endocarditis, as well as the various techniques of partial transient left heart support devices and of cardiac transplantation. In chapter III, the invasive management of chronic coronary heart disease, peripheral vascular disease by balloon catheter or laser techniques, and the surgical approach to coronary heart disease are discussed.

Consumers Digest Jun 12 2021

Ventricular Tachycardias Dec 27 2019 The rhythm of the heart, its normal functioning and pathologic disturbances, has been a favored subject of investigation by clinical and basic scientists in recent decades. This heightened interest and attention was stimulated by the somber and surprising revelations from epidemiologists and pathologists of the enormity of the number of sudden arrhythmic deaths in the Western world, and the concurrent advancement of technology for recording and control of electrical activity of the heart. Technological advancements have included the recording of intracellular potentials from cardiac cells, the recording of intracardiac extra cellular potentials generated by specific cardiac structures, simultaneous recordings from numerous

sites with computer processing for spatial mapping of activation or potential variations with time, high gain, high resolution recordings with signal averaging for detecting potentials of low amplitudes, complex stimulation protocols, various high energy stimulation modes, intracellular voltage control of multicellular preparations and single cardiac cells, and the isolation of single cardiac cells for electrophysiological study. The interest and technology have produced an increasing bounty of information and understanding, acceptable solutions to some clinical problems, and definite progress toward solutions to other problems. Progress in research in electrophysiology and arrhythmias has been reviewed and highlighted in various meetings and books in recent years. Because the body of information has become so large, general overviews of the field have necessarily been superficial in certain aspects or have contained gaps.
